To investigate the effect of olfactory ensheathing glia transplantation into the injured spinal cord of rats. A Contusion injury model was produced on SD rats, The injured rats were then randomized into two groups (n = 50) and were grafted with olfactory ensheathing glia (OEGs) and normal culture medium, respectively. Another control group (n = 7) did not undergo transplantation and were grafted with culture medium. Four animals in the transplant group, 6 animals in the control group, and 3 animals in the sham-operated group were killed and examined at different time points (1, 2, and 4 weeks) postoperatively. The locomotor function of the spinal cord was assessed based on the Basso, Beattie and Bresnahan (BBB) rating scale, and the muscle strength of the bilateral extensor posture 1cdb36666d

This article explores how a native JVM application can work with managed libraries and APIs. On the face of it, it appears to be impossible to use managed libraries in a native application. You might be able to link your native program with a commercial managed JAR file, but that would involve an unacceptably large trade-off in terms of runtime performance. In reality, the managed JDK has no serious impediments to mixing managed and unmanaged code. As long as you are prepared to ignore a few advanced features, the JVM and your native application can happily coexist and cooperate. This article focuses on a native JDK, but the same principles apply to non-JDK native applications. Also, consider that JVMs have evolved since Java 1.1 was introduced in 1996, and the latest version of the JVM is available on Windows, Mac, and Linux. To see the possibilities, we will develop a native port of the popular Java graphics demo application called jogl-raster, written by David Mouton. This application makes heavy use of the Java 2D API, and hence it is a good candidate for testing the process. A native JVM is a JVM with native code for the operating system of the computer. This native code usually comes from C, C++, or a similar language. The JVM makes it

Scarface: The World Is Yours.The present disclosure relates to computing devices, and more particularly to techniques for scheduling a decoding operation on a computing device. A processor core of a computing device generally executes instructions, which are stored in a memory of the computing device, in a pipeline fashion. The instructions for execution by the processor core generally comprise a "basic block" of instructions. A basic block is a sequence of one or more instructions, each of which are one or more machine language instructions. A basic block can correspond to a single instruction, a set of instructions, or a sequence of instructions. During execution of the instructions of a basic block, new instructions are fetched for execution and a decode operation is performed on each of the fetched instructions, but the instructions of the basic block are not yet executed. In some cases, decoding an instruction of a basic block results in one or more "dependent instructions" being fetched for execution. During execution of the instructions of a basic block, a so-called dependency chain is formed between the instructions of the basic block. In the dependency chain, each instruction of the basic block has a dependency on at least one other instruction of the basic block. A dependent instruction in the dependency chain of a particular basic block is a particular instruction of the basic block for which execution of the particular instruction is blocked by the particular instruction's dependency on the particular instruction. In some cases, a decode operation of one of the dependent instructions results in the subsequent fetching and execution of one or more of the basic block's instructions. The decoding of the subsequent instructions by the decoding operation is considered to be dependent on the execution of the previous instructions and so those subsequent instructions are blocked from subsequent execution until the previous instructions are executed. In many
